README

This is a toolbox in form of a python package that handles algorithms to be used in dsp (digital signal processing) projects.

It is a personal project that is under active development and it will take some time until it reaches a certain level of maturity. If you find some implementations interesting or useful, please feel free to use it for your projects and expand or change functionalities.

1.1 Getting Started

Check out the [examples](#) for some basic examples of the dsptools package and refer to Documentation for the complete description of classes and methods.

Note: The documentation at [read the docs](#) is available but not working at the moment because of an internal bug in one of the modules needed to build the package. This will be fixed in the future. Until then, please refer to the other available documentation.

1.2 Installation

Use pip to install dsptools

```
$ pip install dsptools
```

(Requires Python 3.10 or higher)

CLASSES (DSPTOOLS.CLASSES)

The main classes are listed here. For some filterbanks, special classes are used but the api works almost equally as for the main FilterBank class.

2.1 Signal

Signal class

```
class dsptools.classes.signal_class.Signal(path=None, time_data=None, sampling_rate_hz: int =  
48000, signal_type: str = 'general', signal_id: str = "")
```

Bases: `object`

Class for general signals (time series). Most of the methods and supported computations are focused on audio signals, but some features might be generalizable to all kind of time series.

Attributes

- `sampling_rate_hz`
- `signal_id`
- `signal_type`
- `time_data`

Methods

<code>add_channel([path, new_time_data, ...])</code>	Adds new channels to this signal object.
<code>get_coherence()</code>	Returns the coherence matrix.
<code>get_csm([force_computation])</code>	Get Cross spectral matrix for all channels with the shape (frequencies, channels, channels)
<code>get_spectrogram([channel_number, ...])</code>	Returns a matrix containing the STFT of a specific channel.
<code>get_spectrum([force_computation])</code>	Returns spectrum.
<code>get_time_vector()</code>	Returns the time vector associated with the signal.
<code>plot_coherence([returns])</code>	Plots coherence measurements if there are any.
<code>plot_csm([range_hz, logx, with_phase, returns])</code>	Plots the cross spectral matrix of the multichannel signal.
<code>plot_group_delay([range_hz, returns])</code>	Plots group delay of each channel.
<code>plot_magnitude([range_hz, normalize, ...])</code>	Plots magnitude spectrum.
<code>plot_phase([range_hz, unwrap, returns])</code>	Plots phase of the frequency response, only available if the method for the spectrum parameters is not welch.
<code>plot_spectrogram([channel_number, logfreqs, ...])</code>	Plots STFT matrix of the given channel.
<code>plot_time([returns])</code>	Plots time signals.
<code>remove_channel([channel_number])</code>	Removes a channel.
<code>save_signal([path, mode])</code>	Saves the Signal object
<code>set_coherence(coherence)</code>	Sets the coherence measurements of the transfer function.
<code>set_csm_parameters([window_length_samples, ...])</code>	Sets all necessary parameters for the computation of the CSM.
<code>set_spectrogram_parameters([channel_number, ...])</code>	Sets all necessary parameters for the computation of the spectrogram.
<code>set_spectrum_parameters([method, ...])</code>	Sets all necessary parameters for the computation of the spectrum.
<code>set_window(window)</code>	Sets the window used for the IR.
<code>swap_channels(new_order)</code>	Rearranges the channels in the new given order.

`__init__(path=None, time_data=None, sampling_rate_hz: int = 48000, signal_type: str = 'general', signal_id: str = '')`

Signal class that saves mainly time data for being used with all the methods.

Parameters

path

[str, optional] A path to audio files. Reading is done with soundfile. Wave and Flac audio files are accepted. Default: *None*.

time_data

[array_like, np.ndarray, optional] Time data of the signal. It is saved as a matrix with the form (time samples, channel number). Default: *None*.

sampling_rate_hz

[int, optional] Sampling rate of the signal in Hz. Default: 48000.

signal_type

[str, optional] A generic signal type. Some functionalities are only unlocked for impulse responses with 'ir' or 'h1', 'h2' or 'h3'. Default: 'general'.

signal_id

[str, optional] An even more generic signal id that can be used by the user. Default: ''.

Methods

Time data: add_channel, remove_channel, swap_channels.	
Spectrum: set_spectrum_parameters, get_spectrum.	
Cross spectral matrix: set_csm_parameters, get_csm.	
Spectrogram: set_spectrogram_parameters, get_spectrogram.	
Plots: plot_magnitude, plot_time, plot_spectrogram, plot_phase,	plot_csm.
General: save_signal.	
Only for `signal_type` in ('rir', 'ir', 'h1', 'h2', 'h3'):	set_window, set_coherence, plot_group_delay, plot_coherence.

add_channel(*path*: *Optional[str]* = None, *new_time_data*: *Optional[ndarray]* = None, *sampling_rate_hz*: *Optional[int]* = None, *padding_trimming*: *bool* = True)

Adds new channels to this signal object.

Parameters**path**

[str, optional] Path to the file containing new channel information.

new_time_data

[*np.ndarray*, optional] np.array with new channel data.

sampling_rate_hz

[int, optional] Sampling rate for the new data

padding_trimming

[bool, optional] Activates padding or trimming at the end of signal in case the new data does not match previous data. Default: *True*.

get_coherence()

Returns the coherence matrix.

get_csm(*force_computation*=False)

Get Cross spectral matrix for all channels with the shape (frequencies, channels, channels)

Returns**f_csm**

[*np.ndarray*] Frequency vector.

csm

[*np.ndarray*] Cross spectral matrix with shape (frequency, channels, channels).

get_spectrogram(*channel_number*: *int* = 0, *force_computation*: *bool* = False)

Returns a matrix containing the STFT of a specific channel.

Parameters

channel_number

[int, optional] Channel number for which to compute the STFT. Default: 0.

force_computation

[bool, optional] Forces new computation of the STFT. Default: False.

Returns**t_s**

[*np.ndarray*] Time vector.

f_hz

[*np.ndarray*] Frequency vector.

spectrogram

[*np.ndarray*] Spectrogram.

get_spectrum(*force_computation=False*)

Returns spectrum.

Parameters**force_computation**

[bool, optional] Forces spectrum computation.

Returns**spectrum_freqs**

[*np.ndarray*] Frequency vector.

spectrum

[*np.ndarray*] Spectrum matrix for each channel.

get_time_vector()

Returns the time vector associated with the signal.

plot_coherence(*returns: bool = False*)

Plots coherence measurements if there are any.

plot_csm(*range_hz=[20, 20000.0]*, *logx: bool = True*, *with_phase: bool = True*, *returns: bool = False*)

Plots the cross spectral matrix of the multichannel signal.

Parameters**range_hz**

[array_like with length 2, optional] Range of Hz to be showed. Default: [20, 20e3].

logx

[bool, optional] Logarithmic x axis. Default: *True*.

with_phase

[bool, optional] When *True*, the unwrapped phase is also plotted. Default: *True*.

returns

[bool, optional] Gives back figure and axis objects. Default: *False*.

Returns

fig, ax if *returns = True*.

plot_group_delay(*range_hz=[20, 20000]*, *returns: bool = False*)

Plots group delay of each channel. Only works if *signal_type* in ('ir', 'h1', 'h2', 'h3', 'rir').

plot_magnitude(*range_hz*=[20, 20000.0], *normalize*: *str* = '1k', *smoothe*=0, *show_info_box*: *bool* = False, *returns*: *bool* = False)

Plots magnitude spectrum. Change parameters of spectrum with `set_spectrum_parameters`.

Parameters

range_hz

[array_like with length 2, optional] Range for which to plot the magnitude response. Default: [20, 20000].

normalize

[str, optional] Mode for normalization, supported are '1k' for normalization with value at frequency 1 kHz or 'np.max' for normalization with maximal value. Use *None* for no normalization. Default: '1k'.

smoothe

[int, optional] —> not yet implemented

show_info_box

[bool, optional] Plots a info box regarding spectrum parameters and plot parameters. If it is str, it overwrites the standard message. Default: *False*.

returns

[bool, optional] When *True* figure and axis are returned. Default: *False*.

Returns

figure and axis when *returns* = *True*.

plot_phase(*range_hz*=[20, 20000.0], *unwrap*: *bool* = False, *returns*: *bool* = False)

Plots phase of the frequency response, only available if the method for the spectrum parameters is not `welch`.

plot_spectrogram(*channel_number*: *int* = 0, *logfreqs*: *bool* = True, *returns*: *bool* = False)

Plots STFT matrix of the given channel.

plot_time(*returns*: *bool* = False)

Plots time signals.

remove_channel(*channel_number*: *int* = -1)

Removes a channel.

Parameters

channel_number

[int, optional] Channel number to be removed. Default: -1 (last).

property `sampling_rate_hz`

save_signal(*path*: *str* = 'signal', *mode*: *str* = 'wav')

Saves the Signal object

Parameters

path

[str, optional] Path for the signal to be saved. Use only folder/folder/name (without format). Default: 'signal' (local folder, object named signal).

mode

[str, optional] Mode of saving. Available modes are 'wav', 'flac', 'pickle'. Default: 'wav'.

set_coherence(*coherence: ndarray*)

Sets the coherence measurements of the transfer function. It only works for *signal_type* = ('ir', 'h1', 'h2', 'h3', 'rir').

set_csm_parameters(*window_length_samples: int = 1024, window_type='hann', overlap_percent=75, detrend=True, average='mean', scaling='power'*)

Sets all necessary parameters for the computation of the CSM.

Parameters

window_length_samples

[int, optional] Window size. Default: 1024.

overlap_percent

[float, optional] Overlap in percent. Default: 75.

detrend

[bool, optional] Detrending (subtracting mean). Default: True.

average

[str, optional] Averaging method. Choose from 'mean' or 'median'. Default: 'mean'.

scaling

[str, optional] Type of scaling. 'power' or 'spectrum'. Default: 'power'.

set_spectrogram_parameters(*channel_number: int = 0, window_length_samples: int = 1024, window_type: str = 'hann', overlap_percent=75, detrend: bool = True, padding: bool = True, scaling: bool = False*)

Sets all necessary parameters for the computation of the spectrogram.

Parameters

window_length_samples

[int, optional] Window size. Default: 1024.

overlap_percent

[float, optional] Overlap in percent. Default: 75.

detrend

[bool, optional] Detrending (subtracting mean). Default: True.

padding

[bool, optional] Padding signal in the beginning and end to center it. Default: True.

scaling

[bool, optional] Scaling or not after np.fft. Default: False.

set_spectrum_parameters(*method='welch', window_length_samples: int = 1024, window_type='hann', overlap_percent=50, detrend=True, average='mean', scaling='power'*)

Sets all necessary parameters for the computation of the spectrum.

Parameters

method

[str, optional] 'welch' or 'standard'. Default: 'welch'.

window_length_samples

[int, optional] Window size. Default: 1024.

window_type

[str, optional] Choose type of window from the options in scipy.windows. Default: 'hann'.

overlap_percent

[float, optional] Overlap in percent. Default: 50.

detrend

[bool, optional] Detrending (subtracting mean). Default: True.

average

[str, optional] Averaging method. Choose from 'mean' or 'median'. Default: 'mean'.

scaling

[str, optional] Type of scaling. 'power' or 'spectrum'. Default: 'power'.

set_window(window)Sets the window used for the IR. It only works for *signal_type* in ('ir', 'h1', 'h2', 'h3', 'rir').**property signal_id****property signal_type****swap_channels(new_order)**

Rearranges the channels in the new given order.

Parameters**new_order**

[array_like] New rearrangement of channels.

property time_data

2.2 MultiBandSignal

```
class dsptools.classes.multibandsignal.MultiBandSignal(bands=None, same_sampling_rate: bool =
True, info: dict = {})
```

Bases: `object`

The MultiBandSignal class contains multiple Signal objects which are to be interpreted as frequency bands or the same signal. Since every signal has also multiple channels, the object resembles somewhat a 3D-Matrix representation of a signal.

The MultiBandSignal can contain multirate system if the attribute *same_sampling_rate* is set to *False*. A dictionary also can carry all kinds of metadata that might characterize the signals.

Attributes**bands****same_sampling_rate****sampling_rate_hz**

Methods

<code>add_band(sig[, index])</code>	Adds a new band to the MultiBandSignal.
<code>get_all_bands([channel])</code>	Returns a signal with all bands as channels.
<code>remove_band([index, return_band])</code>	Removes a band from the MultiBandSignal.
<code>save_signal([path])</code>	Saves the MultiBandSignal object as a pickle.
<code>show_info([show_band_info])</code>	Show information about the MultiBandSignal.

`__init__(bands=None, same_sampling_rate: bool = True, info: dict = {})`

MultiBandSignal contains a composite band list where each index is a Signal object with the same number of channels. For multirate systems, the parameter *same_sampling_rate* has to be set to *False*.

Parameters

bands

[list or tuple, optional] List or tuple containing different Signal objects. All of them should be associated to the same Signal. This means that the channel numbers have to match. Set to *None* for initializing the object. Default: *None*.

same_sampling_rate

[bool, optional] When *True*, every Signal should have the same sampling rate. Set to *False* for a multirate system. Default: *True*.

info

[dict, optional] A dictionary with generic information about the MultiBandSignal can be passed. Default: *None*.

`add_band(sig: Signal, index: int = -1)`

Adds a new band to the MultiBandSignal.

Parameters

sig

[Signal] Signal to be added.

index

[int, optional] Index at which to insert the new Signal. Default: -1.

property bands

`get_all_bands(channel: int = 0)`

Returns a signal with all bands as channels. Done for an specified channel.

Parameters

channel

[int, optional] Channel to choose from the band signals.

Returns

sig

[Signal or list of *np.ndarray* and dict] Multichannel signal with all the bands. If the MultiBandSignal does not have the same sampling rate for all signals, a list with the time vectors and a dictionary containing their sampling rates with the key 'sampling_rates' are returned.

`remove_band(index: int = -1, return_band: bool = False)`

Removes a band from the MultiBandSignal.

Parameters

index

[int, optional] This is the index from the bands list at which the band will be erased. When -1, last band is erased. Default: -1.

return_band

[bool, optional] When *True*, the erased band is returned. Default: *False*.

property same_sampling_rate

property sampling_rate_hz

save_signal(path: *str* = 'multibandsignal')

Saves the MultiBandSignal object as a pickle.

Parameters**path**

[str, optional] Path for the signal to be saved. Use only folder/folder/name (without format). Default: 'multibandsignal' (local folder, object named multibandsignal).

show_info(show_band_info: *bool* = *False*)

Show information about the MultiBandSignal.

Parameters**show_band_info**

[bool, optional] When *True*, a longer message is printed with all available information regarding each Signal in the MultiBandSignal. Default: *True*.

2.3 Filter

Contains Filter classes

class dsptools.classes.filter_class.**Filter**(filter_type: *str* = 'biquad', filter_configuration: *Optional[dict]* = *None*, sampling_rate_hz: *int* = 48000)

Bases: *object*

Class for creating and storing linear digital filters with all their metadata.

Attributes

sampling_rate_hz

Methods

<code>filter_signal(signal[, channel, ...])</code>	Takes in a Signal object and filters selected channels.
<code>get_coefficients([mode])</code>	Returns the filter coefficients.
<code>get_filter_parameters()</code>	Returns filter parameters.
<code>get_ir([length_samples])</code>	Gets an impulse response of the filter with given length.
<code>initialize_zi([number_of_channels])</code>	Initializes zi for steady-state filtering.
<code>plot_group_delay([length_samples, range_hz, ...])</code>	Plots group delay of the filter.
<code>plot_magnitude([length_samples, range_hz, ...])</code>	Plots magnitude spectrum.
<code>plot_phase([length_samples, range_hz, ...])</code>	Plots magnitude spectrum.
<code>plot_zp([show_info_box, returns])</code>	Plots zeros and poles with the unit circle.
<code>save_filter([path])</code>	Saves the Filter object as a pickle.
<code>set_filter_parameters(filter_type, ...)</code>	
<code>show_filter_parameters()</code>	Prints all the filter parameters to the console.

`__init__`(*filter_type*: *str* = 'biquad', *filter_configuration*: *Optional[dict]* = None, *sampling_rate_hz*: *int* = 48000)

The Filter class contains all parameters and metadata needed for using a digital filter.

Parameters

filter_type

[str, optional] String defining the filter type. Options are *iir*, *fir*, *biquad* or *other*. Default: creates a dummy biquad bell filter with no gain.

filter_configuration

[dict, optional] Dictionary containing configuration for the filter. Default: some dummy parameters.

sampling_rate_hz

[int, optional] Sampling rate in Hz for the digital filter. Default: 48000.

Methods

General: <code>set_filter_parameters</code> , <code>get_filter_parameters</code> , <code>get_ir</code> .	
Plots or prints: <code>show_filter_parameters</code> , <code>plot_magnitude</code> ,	<code>plot_group_delay</code> , <code>plot_phase</code> , <code>plot_zp</code> .
Filtering: <code>filter_signal</code> .	

`filter_signal`(*signal*: *Signal*, *channel*=None, *activate_zi*: *bool* = False, *zero_phase*: *Optional[bool]* = None)

Takes in a Signal object and filters selected channels. Exports a new Signal object.

Parameters

signal

[class:Signal] Signal to be filtered.

channel

[int or array-like, optional] Channel or array of channels to be filtered. When *None*, all channels are filtered. Default: *None*.

activate_zi

[int, optional] Gives the zi to update the filter values. Default: *False*.

zero_phase

[bool, optional] Uses zero-phase filtering on signal. Be aware that the filter is applied twice in this case. Default: *False*.

Returns**new_signal**

[class:Signal] New Signal object.

get_coefficients(mode='sos')

Returns the filter coefficients.

Parameters**mode**

[str, optional] Type of filter coefficients to be returned. Choose from 'sos', 'ba' or 'zpk'. Default: 'sos'.

Returns**coefficients**

[array-like] Array with filter parameters.

get_filter_parameters()

Returns filter parameters.

Returns**info**

[dict] Dictionary containing all filter parameters.

get_ir(length_samples: int = 512)

Gets an impulse response of the filter with given length.

Parameters**length_samples**

[int, optional] Length for the impulse response in samples. Default: 512.

Returns**ir_filt**

[np.ndarray] Impulse response of the filter.

initialize_zi(number_of_channels: int = 1)

Initializes zi for steady-state filtering. The number of parallel zi's can be defined externally.

Parameters**number_of_channels**

[int, optional] Number of channels is needed for the number of filter's zi's. Default: 1.

plot_group_delay(length_samples: int = 512, range_hz=[20, 20000.0], show_info_box: bool = False, returns: bool = True)

Plots group delay of the filter. Different methods are used for FIR or IIR filters.

Parameters

length_samples

[int, optional] Length of ir for magnitude plot. Default: 512.

range_hz

[array-like with length 2, optional] Range for which to plot the magnitude response. Default: [20, 20000].

show_info_box

[bool, optional] Shows an information box on the plot. Default: *False*.

returns

[bool, optional] When *True* figure and axis are returned. Default: *False*.

Returns**fig, ax**

Returned only when *returns=True*.

plot_magnitude(*length_samples*: *int* = 512, *range_hz*=[20, 20000.0], *normalize*: *Optional[str]* = None, *show_info_box*: *bool* = True, *returns*: *bool* = False)

Plots magnitude spectrum. Change parameters of spectrum with *set_spectrum_parameters*.

Parameters**length_samples**

[int, optional] Length of ir for magnitude plot. Default: 512.

range_hz

[array-like with length 2, optional] Range for which to plot the magnitude response. Default: [20, 20000].

normalize

[str, optional] Mode for normalization, supported are '*1k*' for normalization with value at frequency 1 kHz or '*max*' for normalization with maximal value. Use *None* for no normalization. Default: '*1k*'.

show_info_box

[bool, optional] Shows an information box on the plot. Default: *True*.

returns

[bool, optional] When *True* figure and axis are returned. Default: *False*.

Returns**fig, ax**

Returned only when *returns=True*.

plot_phase(*length_samples*: *int* = 512, *range_hz*=[20, 20000.0], *unwrap*: *bool* = False, *show_info_box*: *bool* = False, *returns*: *bool* = False)

Plots magnitude spectrum. Change parameters of spectrum with *set_spectrum_parameters*.

Parameters**length_samples**

[int, optional] Length of ir for magnitude plot. Default: 512.

range_hz

[array-like with length 2, optional] Range for which to plot the magnitude response. Default: [20, 20000].

unwrap

[bool, optional] Unwraps the phase to show. Default: *False*.

show_info_box

[bool, optional] Shows an information box on the plot. Default: *False*.

returns

[bool, optional] When *True* figure and axis are returned. Default: *False*.

Returns**fig, ax**

Returned only when *returns=True*.

plot_zp(*show_info_box*: bool = *False*, *returns*: bool = *False*)

Plots zeros and poles with the unit circle.

Parameters**returns**

[bool, optional] When *True* figure and axis are returned. Default: *False*.

show_info_box

[bool, optional] Shows an information box on the plot. Default: *False*.

Returns**fig, ax**

Returned only when *returns=True*.

property sampling_rate_hz

save_filter(*path*: str = 'filter')

Saves the Filter object as a pickle.

Parameters**path**

[str, optional] Path for the filter to be saved. Use only folder1/folder2/name (without format). Default: 'filter' (local folder, object named filter).

set_filter_parameters(*filter_type*: str, *filter_configuration*: dict)

show_filter_parameters()

Prints all the filter parameters to the console.

2.4 Filterbank

```
class dsptools.classes.filterbank.FilterBank(filters=[], same_sampling_rate: bool = True, info: dict = {})
```

Bases: `object`

Standard template for filter banks containing filters, filters' initial values, metadata and the some useful plotting and filtering methods.

Methods

<code>add_filter(filt[, index])</code>	Adds a new filter at the end of the filters dictionary.
<code>filter_signal(signal[, mode, activate_zi, ...])</code>	Applies the filter bank to a signal and returns a multi-band signal.
<code>initialize_zi([number_of_channels])</code>	Initiates the zi of the filters for the given number of channels.
<code>plot_magnitude([mode, range_hz, test_zi, ...])</code>	Plots the magnitude response of each filter.
<code>remove_filter([index, return_filter])</code>	Removes a filter from the filter bank.
<code>save_filterbank([path])</code>	Saves the FilterBank object as a pickle.
<code>show_info([show_filter_info])</code>	Show information about the filter bank.

`__init__(filters=[], same_sampling_rate: bool = True, info: dict = {})`

FilterBank object saves multiple filters and some metadata. It also allows for easy filtering with multiple filters. Since the digital filters that are supported are linear systems, the order in which they are saved and applied to a signal is not relevant.

Parameters

filters

[list or tuple, optional] List or tuple containing filters.

same_sampling_rate

[bool, optional] When *True*, every Filter should have the same sampling rate. Set to *False* for a multirate system. Default: *True*.

info

[dict, optional] Dictionary containing general information about the filter bank. Some parameters of the filter bank are automatically read from the filters dictionary.

Methods

General: <code>add_filter</code> , <code>remove_filter</code> .	
Prints: <code>show_info</code> .	

`add_filter(filt: Filter, index: int = -1)`

Adds a new filter at the end of the filters dictionary.

Parameters

filt

[Filter] Filter to be added to the FilterBank.

index

[int, optional] Index at which to insert the new Filter. Default: -1.

`filter_signal(signal: Signal, mode: str = 'parallel', activate_zi: bool = False, zero_phase: bool = False)`

Applies the filter bank to a signal and returns a multiband signal. *'parallel'*: returns a MultiBandSignal object where each band is the output of each filter. *'sequential'*: applies each filter to the given Signal in a sequential manner and returns output with same dimension. *'summed'*: applies every filter as parallel and then sums the outputs returning same dimensional output as input.

Parameters

signal

[class:Signal] Signal to be filtered.

mode

[str, optional] Way to apply filter bank to the signal. Supported modes are: *'parallel'*, *'sequential'*, *'summed'*. Default: *'parallel'*.

activate_zi

[bool, optional] Takes in the filter initial values and updates them for streaming purposes. Default: *False*.

zero_phase

[bool, optional] Activates zero_phase filtering for the filter bank. It cannot be used at the same time with *zi=True*. Default: *False*.

Returns**new_sig**

[*'sequential'* or *'summed'* -> Signal.]

'parallel' -> MultiBandSignal

New signal after filtering.

initialize_zi(*number_of_channels: int = 1*)

Initiates the zi of the filters for the given number of channels.

Parameters**number_of_channels**

[int, optional] Number of channels is needed for the number of filters' zi's. Default: 1.

plot_magnitude(*mode: str = 'parallel', range_hz=[20, 20000.0], test_zi: bool = False, returns: bool = False*)

Plots the magnitude response of each filter.

Parameters**mode**

[str, optional] Type of plot. *'parallel'* plots every filter's frequency response, *'sequential'* plots the frequency response after having filtered one impulse with every filter in the FilterBank. *'summed'* sums up every frequency response. Default: *'parallel'*.

range_hz

[array-like, optional] Range of Hz to plot. Default: [20, 20e3].

test_zi

[bool, optional] Uses the zi's of each filter to test the FilterBank's output. Default: *False*.

returns

[bool, optional] When *True*, the figure and axis are returned. Default: *False*.

Returns**fig, ax**

Returned only when *returns=True*.

remove_filter(*index: int = -1, return_filter: bool = False*)

Removes a filter from the filter bank.

Parameters

index

[int, optional] This is the index from the filters list at which the filter will be erased. When -1, last filter is erased. Default: -1.

return_filter

[bool, optional] When *True*, the erased filter is returned. Default: *False*.

save_filterbank(*path*: *str* = 'filterbank')

Saves the FilterBank object as a pickle.

Parameters

path

[str, optional] Path for the filterbank to be saved. Use only folder1/folder2/name (without format). Default: 'filterbank' (local folder, object named filterbank).

show_info(*show_filter_info*: *bool* = *True*)

Show information about the filter bank.

Parameters

show_filters_info

[bool, optional] When *True*, a longer message is printed with all available information regarding each filter in the filter bank. Default: *True*.

MODULES IN DSPTOOLS

The modules and functions of dsptools are listed down below.

3.1 Distances (dsptools.distances)

`dsptools.distances.itakura_saito`(*insig1*: [Signal](#), *insig2*: [Signal](#), *method*: *str* = 'welch', *f_range_hz*=[20, 20000], ***kwargs*)

Computes itakura-saito measure between two signals. Beware that this measure is not symmetric $(x, y) \neq (y, x)$.

Parameters

insig1

[Signal] Signal 1.

insig2

[Signal] Signal 2.

f_range_hz

[array, optional] Range of frequencies in which to compute the distance. When *None*, it is computed in all frequencies. Default: [20, 20000].

`dsptools.distances.log_spectral`(*insig1*: [Signal](#), *insig2*: [Signal](#), *method*: *str* = 'welch', *f_range_hz*=[20, 20000], ***kwargs*)

Computes log spectral distance between two signals.

Parameters

insig1

[Signal] Signal 1.

insig2

[Signal] Signal 2.

f_range_hz

[array, optional] Range of frequencies in which to compute the distance. When *None*, it is computed in all frequencies. Default: [20, 20000].

3.2 Filterbanks (dsptools.filterbanks)

`dsptools.filterbanks.linkwitz_riley_crossovers(freqs, order, sampling_rate_hz: int = 48000)`

Returns a linkwitz-riley crossovers filter bank.

Parameters

freqs

[array-like] Frequencies at which to set the crossovers.

order

[array-like] Order of the crossovers. The higher, the steeper.

sampling_rate_hz

[int, optional] Sampling rate for the filterbank. Default: 48000.

Returns

fb

[LRFILTERBANK] Filter bank in form of LRFILTERBANK class which contains the same methods as the FILTERBANK class but is generated with different internal methods.

3.3 Generators (dsptools.generators)

`dsptools.generators.chirp(type_of_chirp: str = 'log', range_hz=None, length_seconds: float = 1, sampling_rate_hz: int = 48000, peak_level_dbfs: float = -10, number_of_channels: int = 1, fade: str = 'log', padding_end_seconds: Optional[float] = None)`

Creates a sweep signal.

Parameters

type_of_chirp

[str, optional] Choose from 'lin', 'log'. Default: 'log'.

range_hz

[array-like with length 2] Define range of chirp in Hz. When *None*, all frequencies between 1 and nyquist are taken. Default: *None*.

length_seconds

[float, optional] Length of the generated signal in seconds. Default: 1.

sampling_rate_hz

[int, optional] Sampling rate in Hz. Default: 48000.

peak_level_dbfs

[float, optional] Peak level of the signal in dBFS. Default: -10.

number_of_channels

[int, optional] Number of channels (with different noise signals) to be created. Default: 1.

fade

[str, optional] Type of fade done on the generated signal. Options are 'np.exp', 'lin', 'log'. Pass *None* for no fading. Default: 'log'.

padding_end_seconds

[float, optional] Padding at the end of signal. Use *None* to avoid any padding. Default: *None*.

Returns

chirp_sig
[Signal] Chirp Signal object.

References

<https://de.wikipedia.org/wiki/Chirp>

`dsptools.generators.dirac(length_samples: int = 512, number_of_channels: int = 1, sampling_rate_hz: int = 48000)`

Generates a dirac impulse Signal with the specified length and sampling rate.

Parameters

length_samples
[int, optional] Length in samples. Default: 512.

number_of_channels
[int, optional] Number of channels to be generated with the same impulse. Default: 1.

sampling_rate_hz
[int, optional] Sampling rate to be used. Default: 480000.

Returns

imp
[Signal] Signal with dirac impulse.

`dsptools.generators.noise(type_of_noise: str = 'white', length_seconds: float = 1, sampling_rate_hz: int = 48000, peak_level_dbfs: float = -10, number_of_channels: int = 1, fade: str = 'log', padding_end_seconds: Optional[float] = None)`

Creates a noise signal.

Parameters

type_of_noise
[str, optional] Choose from 'white', 'pink', 'red', 'blue', 'violet'. Default: 'white'.

length_seconds
[float, optional] Length of the generated signal in seconds. Default: 1.

sampling_rate_hz
[int, optional] Sampling rate in Hz. Default: 48000.

peak_level_dbfs
[float, optional] Peak level of the signal in dBFS. Default: -10.

number_of_channels
[int, optional] Number of channels (with different noise signals) to be created. Default: 1.

fade
[str, optional] Type of fade done on the generated signal. Options are 'exp', 'lin', 'log'. Pass *None* for no fading. Default: 'log'.

padding_end_seconds
[float, optional] Padding at the end of signal. Use *None* to avoid any padding. Default: *None*.

Returns

noise_sig
[Signal] Noise Signal object.

References

https://en.wikipedia.org/wiki/Colors_of_noise

3.4 Measure (dsptools.measure)

`dsptools.measure.play(signal: Signal, duration_seconds: Optional[float] = None, normalized_dbfs: float = -6, device: Optional[str] = None, play_channels=None)`

Play some available device. Note that the channel numbers start here with 1.

Parameters

signal

[Signal] Signal to be reproduced. Its channel number must match the the length of the `play_channels` vector.

duration_seconds

[float, optional] If *None*, the whole signal is played, otherwise it is trimmed to the given length. Default: *None*.

normalized_dbfs: float, optional

Normalizes the signal (dBFS peak level) before playing it. Set to *None* to ignore normalization. Default: -6.

device

[str, optional] I/O device to be used. If *None*, the default device is used. Default: *None*.

play_channels

[int or array-like, optional] Output channels that will play the signal. The number of channels should match the number of channels in signal. When *None*, the channels are automatically set. Default: *None*.

`dsptools.measure.play_and_record(signal: Signal, duration_seconds: Optional[float] = None, normalized_dbfs: float = -6, device: Optional[str] = None, play_channels=None, rec_channels=[1])`

Play and record using some available device. Note that the channel numbers start here with 1.

Parameters

signal

[Signal] Signal object to be played. The number of channels has to match the total length and order of `play_channels`. The sampling rate of signal will define the sampling rate of the recorded signals.

duration_seconds

[float, optional] If *None*, the whole signal is played, otherwise it is trimmed to the given length. Default: *None*.

normalized_dbfs: float, optional

Normalizes the signal (dBFS peak level) before playing it. Set to *None* to ignore normalization. Default: -6.

device

[str, optional] I/O device to be used. If *None*, the default device is used. Default: *None*.

play_channels

[int or array-like, optional] Output channels that will play the signal. The number of channels

should match the number of channels in signal. When *None*, the channels are automatically set. Default: *None*.

rec_channels

[int or array-like, optional] Channel numbers that will be recorded. Default: [1].

Returns

rec_sig

[Signal] Recorded signal.

`dsptools.measure.print_device_info(device_number: Optional[int] = None)`

Prints available audio devices or information about a certain device when the device number is given.

Parameters

device_number

[int, optional] Prints information about the specific device and returns it as a dictionary. Use *None* to ignore. Default: *None*.

Returns

d

[dict] Only when *device_number* is not *None*.

`dsptools.measure.record(duration_seconds: float = 5, sampling_rate_hz: int = 48000, device: Optional[str] = None, rec_channels=[1])`

Record using some available device. Note that the channel numbers start here with 1.

Parameters

duration_seconds

[float, optional] Duration of recording in seconds. Default: 5.

sampling_rate_hz

[int, optional] Sampling rate used for recording. Default: 48000.

device

[str, optional] I/O device to be used. If *None*, the default device is used. Default: *None*.

rec_channels

[int or array-like, optional] Number that will be recorded. Default: [1].

Returns

rec_sig

[Signal] Recorded signal.

`dsptools.measure.set_device(device_number: Optional[int] = None)`

Takes in a device number to set it as the default. If *None* is passed, the available devices are first shown and then the user is asked for input to set the device.

Parameters

device_number

[int, optional] Sets the device as default. Use *None* to ignore. Default: *None*.

3.5 Plots (dsptools.plots)

`dsptools.plots.general_matrix_plot`(*matrix*, *range_x*=None, *range_y*=None, *range_z*=None, *xlabel*:
Optional[str] = None, *ylabel*: Optional[str] = None, *zlabel*:
Optional[str] = None, *xlog*: bool = False, *ylog*: bool = False,
colorbar: bool = True, *cmap*: str = 'magma', *returns*: bool = False)

Generic plot template with subplots in one column or row.

Parameters

matrix

[*np.ndarray*] Matrix with data to plot.

range_x

[array-like, optional] Range to show for x axis. Default: None.

range_y

[array-like, optional] Range to show for y axis. Default: None.

xlabel

[str, optional] Label for x axis. Default: None.

ylabel

[str, optional] Label for y axis. Default: None.

zlabel

[str, optional] Label for z axis. Default: None.

xlog

[bool, optional] Show x axis as logarithmic. Default: *False*.

ylog

[bool, optional] Show y axis as logarithmic. Default: *False*.

colorbar

[bool, optional] When *True*, a colorbar for zaxis is shown. Default: *True*.

cmap

[str, optional] Type of colormap to use from matplotlib. See <https://matplotlib.org/stable/tutorials/colors/colormaps.html>. Default: 'magma'.

returns

[bool, optional] When *True*, the figure and axis are returned. Default: *False*.

Returns

fig, ax

Returned only when *returns=True*.

`dsptools.plots.general_plot`(*x*, *matrix*, *range_x*=None, *range_y*=None, *log*: bool = True, *labels*=None,
xlabel: str = 'Frequency / Hz', *ylabel*: Optional[str] = None, *info_box*:
Optional[str] = None, *returns*: bool = False)

Generic plot template.

Parameters

x

[array-like] Vector for x axis.

matrix

[*np.ndarray*] Matrix with data to plot.

range_x
[array-like, optional] Range to show for x axis. Default: *None*.

range_y
[array-like, optional] Range to show for y axis. Default: *None*.

log
[bool, optional] Show x axis as logarithmic. Default: *True*.

xlabel
[str, optional] Label for x axis. Default: *None*.

ylabel
[str, optional] Label for y axis. Default: *None*.

info_box
[str, optional] String containing extra information to be shown in a info box on the plot.
Default: *None*.

returns
[bool, optional] When *True*, the figure and axis are returned. Default: *False*.

Returns

fig, ax
Returned only when *returns=True*.

`dsptools.plots.general_subplots_line(x, matrix, column: bool = True, sharex: bool = True, sharey: bool = False, log: bool = False, ylabels=None, xlabels=None, range_x=None, range_y=None, returns: bool = False)`

Generic plot template with subplots in one column or row.

Parameters

x
[array-like] Vector for x axis.

matrix
[*np.ndarray*] Matrix with data to plot.

column
[bool, optional] When *True*, the subplots are organized in one column. Default: *True*.

sharex
[bool, optional] When *True*, all subplots share the same values for the x axis. Default: *True*.

sharey
[bool, optional] When *True*, all subplots share the same values for the y axis. Default: *False*.

log
[bool, optional] Show x axis as logarithmic. Default: *False*.

ylabels
[array_like, optional] Labels for y axis. Default: *None*.

xlabels
[array_like, optional] Labels for x axis. Default: *None*.

range_x
[array-like, optional] Range to show for x axis. Default: *None*.

range_y
[array-like, optional] Range to show for y axis. Default: *None*.

returns

[bool, optional] When *True*, the figure and axis are returned. Default: *False*.

Returns**fig, ax**

Returned only when *returns=True*.

`dsptools.plots.show()`

Wrapper around matplotlib's show.

3.6 Room acoustics (`dsptools.room_acoustics`)

`dsptools.room_acoustics.convolve_rir_on_signal` (*signal*: [Signal](#), *rir*: [Signal](#), *keep_peak_level*: *bool* = *True*, *keep_length*: *bool* = *True*)

Applies an RIR to a given signal. The RIR should also be a signal object with a single channel containing the RIR time data. Signal type should also be set to IR or RIR. By default, all channels are convolved with the RIR.

Parameters**signal**

[Signal] Signal to which the RIR is applied. All channels are affected.

rir

[Signal] Single-channel Signal object containing the RIR.

keep_peak_level

[bool, optional] When *True*, output signal is normalized to the peak level of the original signal. Default: *True*.

keep_length

[bool, optional] When *True*, the original length is kept after convolution, otherwise the output signal is longer than the input one. Default: *True*.

Returns**new_sig**

[Signal] Convolved signal with RIR.

`dsptools.room_acoustics.find_modes` (*signal*: [Signal](#), *f_range_hz*=[50, 200], *proximity_effect*: *bool* = *False*, *dist_hz*: *float* = 5)

This method is NOT validated. It might not be sufficient to find all modes in the given range.

Computes the room modes of a set of RIR using different criteria: Complex mode indication function, sum of magnitude responses and group delay peaks of the first RIR.

Parameters**signal**

[Signal] Signal containing the RIR'S from which to find the modes.

f_range_hz: array_like, optional

Vector setting range for mode search. Default: [50, 200].

proximity_effect: bool, optional

When *True*, only group delay criteria is used for finding modes up until 200 Hz. This is done since a gradient transducer will not easily see peaks in its magnitude response in low frequencies due to near-field effects. There is also an assessment that the modes are not dips of the magnitude response. Default: *False*.

dist_hz: float, optional

Minimum distance (in Hz) between modes. Default: 5.

Returns

f_modes: *np.ndarray*

Vector containing frequencies *np.where* modes have been localized.

References

<http://papers.vibetech.com/Paper17-CMIF.pdf>

`dsptools.room_acoustics.reverb_time(signal: Signal, mode: str = 'T20')`

Computes reverberation time. T20, T30, T60 and EDT.

Parameters

signal

[Signal] Signal for which to compute reverberation times. It must be type '*ir*' or '*rir*'.

mode

[str, optional] Reverberation time mode. Options are '*T20*', '*T30*', '*T60*' or '*EDT*'. Default: '*T20*'.

Returns

reverberation_times

[*np.ndarray*] Reverberation times for each channel.

References

- DIN 3382
- ISO 3382-1:2009-10, Acoustics - Measurement of the reverberation time of

rooms with reference to other acoustical parameters. pp. 22.

3.7 Special (dsptools.special)

`dsptools.special.cepstrum(signal: Signal, mode='power')`

Returns the cepstrum of a given signal in the Quefrency domain.

Parameters

signal

[Signal] Signal to compute the cepstrum from.

mode

[str, optional] Type of cepstrum. Supported modes are '*power*', '*real*' and '*complex*'. Default: '*power*'.

Returns

que

[*np.ndarray*] Quefrency.

ceps

[*np.ndarray*] Cepstrum.

References

<https://de.wikipedia.org/wiki/Cepstrum>

3.8 Standard functions (dsptools.*)

`dsptools.standard_functions.excess_group_delay(signal: Signal)`

Computes excess group delay.

Parameters

signal

[Signal] Signal object for which to compute minimal group delay.

Returns

f

[*np.ndarray*] Frequency vector.

ex_gd

[*np.ndarray*] Excess group delays in seconds.

`dsptools.standard_functions.group_delay(signal: Signal, method='direct')`

Computation of group delay.

Parameters

signal

[Signal] Signal for which to compute group delay.

method

[str, optional] 'direct' uses gradient with unwrapped phase. 'matlab' uses this implementation: https://www.dsprelated.com/freebooks/filters/Phase_Group_Delay.html

Returns

freqs

[*np.ndarray*] Frequency vector in Hz.

group_delays

[*np.ndarray*] Matrix containing group delays in seconds.

`dsptools.standard_functions.latency(in1: Signal, in2: Optional[Signal] = None)`

Computes latency between two signals using the correlation method. If there is no second signal, the latency between the first and the other channels of the is computed.

Parameters

in1

[Signal] First signal.

in2

[Signal, optional] Second signal. Default: *None*.

Returns

latency_per_channel_samples

[*np.ndarray*] Array with latency between two signals in samples per channel.

`dsptools.standard_functions.minimal_group_delay(signal: Signal)`

Computes minimal group delay

Parameters

signal

[Signal] Signal object for which to compute minimal group delay.

Returns

f

[*np.ndarray*] Frequency vector.

min_gd

[*np.ndarray*] Minimal group delays in seconds as matrix.

`dsptools.standard_functions.minimal_phase(signal: Signal)`

Gives back a matrix containing the minimal phase for every channel.

Parameters

signal

[Signal] Signal for which to compute the minimal phase.

Returns

f

[*np.ndarray*] Frequency vector.

min_phases

[*np.ndarray*] Minimal phases as matrix.

`dsptools.standard_functions.pad_trim(signal: Signal, desired_length_samples: int, in_the_end: bool = True)`

Returns a copy of the signal with padded or trimmed time data.

Parameters

signal

[Signal] Signal to be padded or trimmed.

desired_length_samples

[int] Length of resulting signal.

in_the_end

[bool, optional] Defines if padding or trimming should be done in the beginning or in the end of the signal. Default: *True*.

Returns

new_signal

[Signal] New padded signal.

3.9 Transfer functions (dsptools.transfer_functions)

`dsptools.transfer_functions.compute_transfer_function(output: Signal, input: Signal, mode='h2',
multichannel: bool = True,
window_length_samples: int = 1024,
**kwargs)`

Gets transfer function H1, H2 or H3. H1: for noise in the output signal. G_{xy}/G_{xx} . H2: for noise in the input signal. G_{yy}/G_{yx} . H3: for noise in both signals. $G_{xy} / np.abs(G_{xy}) * (G_{yy}/G_{xx})^{**0.5}$.

Parameters

output

[Signal] Signal with output channels.

input

[Signal] Signal with input channels.

mode

[str, optional] Type of transfer function. 'h1', 'h2' and 'h3' are available. Default: 'h2'.

multichannel

[bool, optional] When *True*, only the first channel of input is used for all output channels. Default: *True*.

window_length_samples

[int, optional] Window length for the IR. Spectrum has the length $\text{window_length_samples} // 2 + 1$. Default: 1024.

**kwargs

[dict, optional] Extra parameters for the computation of the cross spectral densities using welch's method.

Returns

tf

[Signal] Transfer functions. Coherences are also computed and saved in the Signal object.

`dsptools.transfer_functions.spectral_deconvolve(num: Signal, denum: Signal, multichannel=False,
mode='regularized', start_stop_hz=None,
threshold_db=-30, padding: bool = False,
keep_original_length: bool = False)`

Deconvolution by spectral division of two signals.

Parameters

num

[Signal] Signal to deconvolve from.

denum

[Signal] Signal to deconvolve.

multichannel

[bool, optional] When *True*, the first channel of denum is used for all channels in num. Default: *False*.

mode

[str, optional] 'window' uses a spectral window in the numerator. 'regularized' uses a regularized inversion. 'standard' uses direct deconvolution. Default: 'regularized'.

start_stop_hz

[array, None, optional] *'automatic'* uses a threshold dBFS to create a spectral window for the numerator or regularized inversion. Array of 2 or 4 frequency points can be also manually given. *None* uses no spectral window.

threshold

[int, optional] Threshold in dBFS for the automatic creation of the window. Default: -30.

padding

[bool, optional] Pads the time data with 2 length. Done for separating distortion in negative time bins when deconvolving sweep measurements. Default: *False*.

keep_original_length

[bool, optional] Only regarded when padding is *True*. It trims the newly deconvolved data to its original length. Default: *False*.

Returns**new_sig**

[Signal] Deconvolved signal.

`dsptools.transfer_functions.window_ir(signal: Signal, constant_percentage=0.75, exp2_trim: int = 13, window_type='hann', at_start: bool = True)`

Windows an IR with trimming and selection of constant valued length.

Parameters**signal: Signal**

Signal to window

constant_percentage: float, optional

Percentage (between 0 and 1) of the window that should be constant value. Default: 0.75

exp2_trim: int, optional

Exponent of two defining the length to which the IR should be trimmed. For avoiding trimming set to *None*. Default: 13.

window_type: str, optional

Window function to be used. Available selection from `scipy.signal.windows`: *barthann*, *bartlett*, *blackman*, *boxcar*, *cosine*, *hamming*, *hann*, *flatop*, *nuttall* and others without extra parameters. Default: *hann*.

at_start: bool, optional

Windows the start with a rising window as well as the end. Default: *True*.

Returns**new_sig**

[Signal] Windowed signal. The used window is also saved under *new_sig.window*.
